

A-Tune 介绍

重庆大学 - 操作系统翻转课堂

02 A-Tune架构

03 A-Tune在线静态调优

04 A-Tune离线动态调优

05 A-Tune使用流程

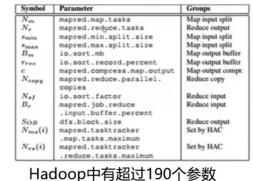

- 操作系统中参数数量多,这些参数之间存在复杂的相关性
- 这些可调节的参数控制着运行的各个方面

Business

Intelligence

Analytics and

Cassan

▶ 上层应用系统种类多

Vertical Apps

Ad/Media Apps

人工调优

- > 调优时间长
- ▶ 依赖人工经验知识
- > 高昂的人工成本
- > 丰富的调优经验

智能调优

- ▶ 时间短
- > 无需人工经验知识
- > 仅需要机器成本
- > 难以积累经验

目标:针对给定的应用负载,利用机器学习技术找到最优的参数使应用获得最佳性能

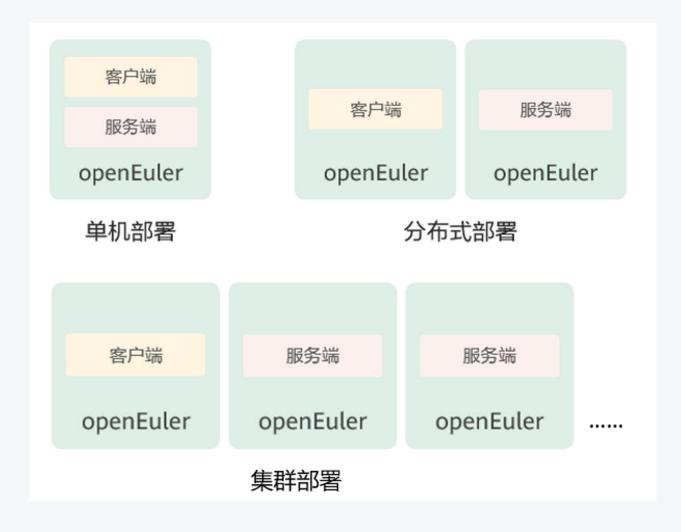

A-Tune架构

A-Tune整体架构

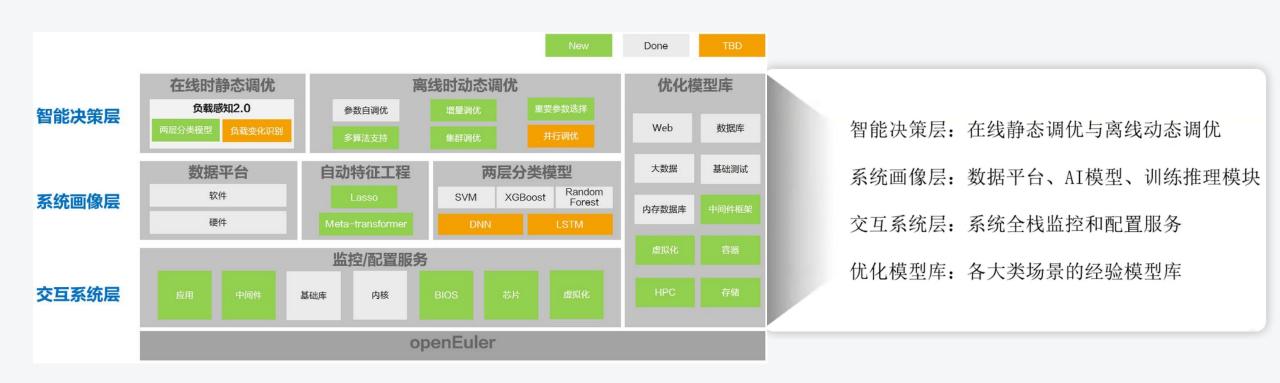

A-Tune整体上是一个C/S架构,以便于进行分布式和集群部署

A-Tune核心技术架构

A-Tune 目标:全面感知计算、存储、网络等应用负载资源,支持行业主流应用,实现全栈协同优化,实现大规模业务迁移,达到极简体验,高效调优的目的

在线静态调优

A-Tune 在线静态调优

场景: 普通用户, 应用需一直保持运行

思路: 感知当前应用负载,通过分类模型,匹配到已知负载,直接输出经验参数

关键技术

✓ 重要特征分析:自动选择重要特征,剔除元余特征,实现精准用户画像

✓ 两层分类模型: 准确识别当前负载

✓ 负载变化感知: 主动识别应用负载的变化, 实现自适应调优

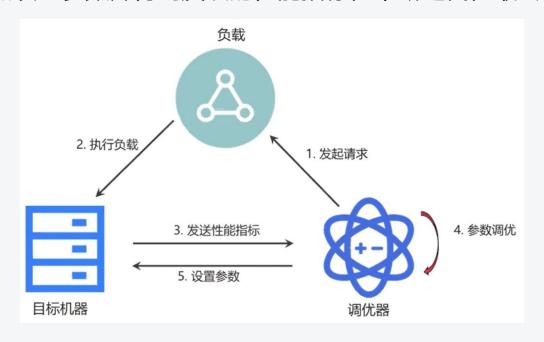

离线动态调优

A-Tune 离线动态调优

场景: 高阶用户, 对性能要求高

思路: 调优器给目标机器设置参数并得到反馈的性能指标,不断迭代,最终得到最优参数

关键技术

✓ 重要参数选择:自动选择重要的调优参数,减少搜索空间,提升训练效率

✓ 调优算法构建: 用户可从适用场景、参数类型、性能要求等方面选择最优算法

✓ 知识库构建:将当前负载特征和最优参数增加到知识库,提升后续调优效率

1. 编写调优脚本

- ① Benchmark 脚本:
 - > 运行测试,并输出指标
- ② Tuning Client yaml 脚本:
 - ▶ 提供从benchmark输出提取指标的方法
 - > 定义迭代轮数及算法
- ③ Tuning Server yaml 脚本:
 - 定义待调节项,包括设置、获取方法

编写调优脚本-Benchmark 脚本

- ✓ 启动生产者及消费者进程
- ✓ 10min之后 kill 生产者及消费者进程
- ✓ 根据生产者和消费者日志计算性能指标 并输出

```
# run test
cd /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/bin; sh start.sh
ssh l0.33.50.23 'source /etc/profile; cd /opt/huawei/l.3.l3.l00/liaofkafkaconsumer/bin; sh start.sh'

# wait for a period of time
totaltime=l0
for i in $(seq 1 $totaltime); do
echo "test running progress: ($i / $totaltime) minutes..."
sleep 60
done

# kill test programs
echo 'kill producer...'
pid='ps aux | grep dmq-demo | grep -v grep | awk '{print $2}' | head -l'
[ "spid" == "" ] && echo 'producer is not running!'
[ "spid" != "" ] && echo "producer pid is $pid" && kill -9 $pid
echo 'kill producer done'
ssh l0.33.50.23 'sh /home/A-Tune/kill.sh' 2>/dev/null

# extract test result
echo "producer tps: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.l3.l00/KOPsdv2dmq-demo-l.3.l3.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.la.l00/KOPsdv2dmq-demo-l.3.la.l00/logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.la.l00/KOPsdv2dmq-demo-l.3.la.l00/Logs/nohup.out | grep 'TAG: producer' |
echo "delay: 'cat /opt/huawei/l.3.la.l00/KOPsdv2dmq-demo-l.3.la.l00/Lo
```

编写调优脚本-Tuning Client yaml 脚本

- ✓ 指定benchmark脚本
- ✓ 从benchmark输出中提取相关性 能指标
- ✓ 设置各个指标的调优权重
- ✓ 迭代轮数及调优算法

```
evaluations :
    info:
        get: "echo '$out' | grep 'producer_tps:' | awk '{print $2}'
type: "negative"
        weight: 2
    name: "delay
    info:
        get: "echo 'sout' | grep 'delay:' | awk '{print $2}'
type: "nositive"
        weight: 25
    name: "comsumer tp
    info:
        get: "echo '$out' | grep 'consumer_tps:' | awk '{print $2}'
        type
        weight:
    info:
        get: "echo '$out' | grep 'consumer_min_tps:' | awk '{print $2}''
type: "negative"
```

编写调优脚本-Tuning Server yaml 脚本

- ✓ 待调优参数 Get/Set 方法 (通过 ssh 远程控制集群节点)
- ✓ 调优参数类型
- ✓ 调优参数范围

```
name : "vm.dirty_background_bytes"
info :
    desc : "Contains the amount of dirty memory at which get : "sh /home/A-Tune/get-bytes.sh"
    set : "sh /home/A-Tune/set-bytes.sh $value"
    needrestart : "false"
    type : "discrete"
    scope :
        - 0
        - 107374182400
    step : 524288000
    items :
    dtype : "int"
```

```
name : "vm.dirty_background_ratio"
info :
    desc : "Contains the amount of dirty memory at which
    get : "sh /home/A-Tune/get-ratio.sh"
    set : "sh /home/A-Tune/set-ratio.sh $value"
    needrestart : "false"
    type : "discrete"
    scope :
        - 0
        - 100
    step : 1
    items :
    dtype : "int"
```

开始Tuning调优

- > sh prepare.sh
- > atune-adm tuning --project kafka2 --detail kafka_client.yaml

```
Current Tuning Progress.....(38/40)
Used time: 2h5m51s, Total Time: 2h5m51s, Best Performance: (producer tps=277021.00,delay=109.50,c
The 38th recommand parameters is: vm.dirty background ratio=58
The 38th evaluation value: (producer tps=265710.00, delay=114.00, comsumer tps=265558.00, consumer m
Current Tuning Progress.....(39/40)
Used time: 2h9m4s, Total Time: 2h9m4s, Best Performance: (producer tps=277021.00,delay=109.50,com
The 39th recommand parameters is: vm.dirty background ratio=41
The 39th evaluation value: (producer_tps=264803.00,delay=114.50,comsumer_tps=263882.00,consumer_m
Current Tuning Progress.....(40/40)
Used time: 2h12m17s, Total Time: 2h12m17s, Best Performance: (producer tps=277021.00, delay=109.50
The 40th recommand parameters is: vm.dirty background ratio=21
The 40th evaluation value: (producer tps=264585.00, delay=114.75, comsumer tps=264462.00, consumer m
The final optimization result is: vm.dirty background ratio=0
The final evaluation value is: producer tps=277021.00, delay=109.50, comsumer tps=277280.00, consume
Baseline Performance is: (producer tps=262172.00,delay=116.00,comsumer tps=262523.00,consumer min
Tuning Finished
```

最优参数

- ✓ 设置 vm.dirty_background_ratio=0 为最优配置。✓ 相比原始默认值 vm.dirty_background_ratio=10 提升约5%。

测试编号	vm.dirty_ backgroun d_ratio	producer_t ps	delay	comsumer_t	consumer_m in_tps	与基线对比 (vm. dirty_b ackground_ ratio=10)
1	42	265260	114.5	265469	263110	1.30%
